

Bookeye 4 is the first and only scanner in the world which scans flat subject matter at 180° and books in V-shape at 120°. Scanning books in V-shape protects the binding and is the most natural way a book can be handled. The book cradles can also be manually separated up to 100mm or 4 inches to accommodate for and protect the spine.

Bookeye 4 not only scans at 120° and 180° without any degradation in image quality, resolution or other parameters, it also detects the position automatically freeing the user from worrying about correct settings.

A unique camera design lets Bookeye 4 follow almost any curvature, even a book opened at 120° instead of the normal 180°. Scanning in V-mode has never been seen on a real scanner before. Only devices that have two digital cameras mounted at 120° angle could handle books in a V-shaped cradle up to now -- not real scanners but [resolution-limited digicams](#) that can scan ONLY in V-shape.

A fast prescan determines the exact curvature of the subject matter as well as the position of the cradles. The two lamps, line camera and lens autofocus system work seamlessly to illuminate the object, avoiding reflections and shadows. The electronic gear gently sweeps over the surface of the object maintaining perfect focus and captures the image line by line with the highest possible resolution and quality.

- ✓ Scan flat at 180°
- ✓ Scan folder at two different planes
- ✓ Scan books at 120° in V-mode
